

Problem Set on Optimal Control

Pascal Michailat

Problem 1

Consider the following optimal growth problem: Given initial capital $k_0 > 0$, choose a consumption path $\{c_t\}_{t \geq 0}$ to maximize utility

$$\int_0^{\infty} e^{-\rho t} \ln(c_t) dt$$

subject to the law of motion of capital

$$\dot{k}_t = f(k_t) - c_t - \delta k_t.$$

The discount rate $\rho > 0$, and the production function f satisfies

$$f(k) = ak^{\alpha},$$

where $\alpha \in (0, 1)$ and $a > 0$.

A. Write down the present-value Hamiltonian.

B. Show that the Euler equation is

$$\frac{\dot{c}_t}{c_t} = \alpha a k_t^{\alpha-1} - (\delta + \rho).$$

C. Solve for the steady state of the system.

Problem 2

Consider the following investment problem: Given initial capital k_0 , choose the investment path $\{i_t\}_{t \geq 0}$ to maximize profits

$$\int_0^{\infty} e^{-rt} \left[f(k_t) - i_t - \frac{\chi}{2} \cdot \frac{i_t^2}{k_t} \right] dt$$

subject to the law of motion of capital (we assume no capital depreciation)

$$\dot{k}_t = i_t.$$

The interest rate $r > 0$, the capital adjustment cost $\chi > 0$, and the production function f satisfies $f' > 0$ and $f'' < 0$.

- A. Write down the current-value Hamiltonian.
- B. Use the optimality conditions for the current-value Hamiltonian to derive the following differential equations:

$$\begin{aligned} \dot{k}_t &= \frac{q_t - 1}{\chi} \cdot k_t \\ \dot{q}_t &= rq_t - f'(k_t) - \frac{1}{2\chi} \cdot (q_t - 1)^2 \end{aligned}$$

- C. Solve for the steady state.
